

CERTIFICATE

OF TECHNOLOGY ASSESSMENT

CrystalStream water quality vault for Stormwater Treatment (CrystalStream Technologies)

*Based on a review of the data and the information submitted in support of the technology, the ministry concludes that the **CrystalStream water quality vault**, by **CrystalStream Technologies**, may be applied to the treatment of stormwater to remove debris, settleable solids and their associated pollutants, oil, and floatables.*

The CrystalStream water quality vault may be applicable to spill control, pre-treatment, or end-of-pipe control for the management of stormwater at smaller sites (as part of a multi-component approach) where stormwater management options are limited. Such applications would include urban and highway sites with high imperviousness and where pollutant loads in stormwater are expected to be high.

The NETE evaluation is not considered an approval or implied approval of the technology and it in no way removes or limits the obligation to obtain the necessary environmental approvals under the Ontario Water Resources Act or the Environmental Protection Act for an application of the technology. The ministry approval process ensures the applicability of the technology against site-specific performance and environmental requirements.
