

**Single Vault System**

## CrystalClean Separator

This is our original product and the most popular. Outstanding test results in the field have shown this product to be capable of stand-alone water quality treatment on many sites and in most jurisdictions. Please check out our field test results in our downloads section. For each test, the agency purchased a commercially available stock device and then tested the device at their expense, analyzed the results, and published their own report without our participation or our funds. These were true, third-party tests. The results speak for themselves. For critical sites or jurisdictions with highly restrictive requirements, this machine is an effective pre-treatment or full treatment system that controls trash, debris, accidental spills, and will remove 89% of all solids that reach the device. From high density hot spots to pre-treatment for sensitive land-based LID applications, this is the machine of choice. The CrystalClean separator can treat water quality flows from 0.4 to 9.95 cfs and typically remain on-line for maximum flows of 2 to 36 cfs over the range of models. We can help engineers design arrays and diversions for many more possibilities if your flows are above 36 cfs. Whether you know what you need or are unsure of the proper CrystalClean model to use, please click the Design Form button to let us get started on your site-specific design.
